

The clinician has 3 patients he works closely with: Angela(15), Whitney(25) and Jake(35), outside of regular check ups these patients regularly share their personal mood diary reports with the clinician.

Angela and Whitney are going on holidays this week and will miss their weekly appointments. The clinician instructed them to submit their weekly reports instead so that he can check up on how they're doing without having to shorten their trip.

Jake has been a long term patient of the clinician but has decided that it's time for him to stop meeting up with the clinician as he is in a good place. The clinician had a final meeting with Jake a week ago and now he is deleting the user from the active list on his app.

A day into her trip, Angela had a bad evening and was upset, she filled out a daily report in her mood diary and submitted it to the clinician for the sake of making him aware of what happened. The clinician got a notification of the report and checked it out as he was eating dinner. He looked over all of the graphs and concluded that every once in a while Angela has a bad time, usually during the evenings.
